EDUCATIONAL DEMONSTRATION REFERENCE ? NOT AUTHENTIC INVESTIGATIVE RECORDS
Windows authentication and logon forensics

Event ID 4624 records a successful logon; 4625 records a failed logon; 4672 indicates special privileges assigned to a new logon. Logon type helps characterize context: type 2 is interactive, type 3 network, type 4 batch, type 5 service, type 7 unlock, type 10 remote interactive (commonly Remote Desktop), and type 11 cached interactive. Interpret fields such as account, source address, workstation, authentication package, and logon ID in context and correlate with other records.

Limitations: event collection may be disabled, filtered, overwritten, incomplete, or altered; fields can be absent or environment-specific. A source address may identify an intermediary. Event presence alone does not establish who operated a system or intent. Validate time zones, clock drift, retention, audit policy, and corroborate with independent sources. These are reference examples, not case evidence.
